Instructions

1. You should attempt all 40 multiple choice questions (MCQs). Each question is worth one mark.
2. There is only one correct answer per question.
3. You need to answer 28 questions correctly to pass the exam.
4. You have 90 minutes to complete this exam.
5. This is an '**open book**' exam. You can use the *ITIL Product (Version 5)* Official Book.
6. Use the Scenario Booklet ITIL Car Rental (ICR) Scenario for additional context.
7. No materials are allowed other than the exam paper, the *ITIL Product (Version 5)* Official Book, and the Scenario Booklet.
8. Do not use information from one question to answer another.

1. A digital product vendor regularly reviews how its product helps customers achieve their desired outcomes. Before prioritizing new features, the team evaluates whether proposed changes solve real user problems, improve service outcomes, or strengthen long-term benefits for customers and service providers.

Which ITIL Guiding Principle is being applied in this scenario?

- A. Progress iteratively with feedback
- B. Optimize and automate
- C. Focus on value
- D. Keep it simple and practical

2. Which statement is **NOT TRUE** about digital products?

- A. They rely on software and virtual infrastructure
- B. They can be diagnosed without on-site intervention
- C. They depend on physical delivery
- D. They are used and improved simultaneously

3. Which of the following statement is **TRUE** about the digital product and service lifecycle?

- A. The scope and order of lifecycle management activities are fixed and do not change
- B. Value chain activities are always performed in a strict sequence
- C. Operate, deliver, and support must occur one after another in a strict sequence
- D. Lifecycle management activities should be managed in a holistic and integrated way

4. An organization has completed the design of a new digital self-service portal. The team deploys the solution into the live environment, migrating user data from the old system, training support staff, and validating that the service meets agreed performance and security requirements.

Which lifecycle management activity is being **PRIMARILY** performed in this scenario?

- A. Build
- B. Transition
- C. Operate
- D. Support

5. An IT service provider onboards a new user to its managed workplace service. The provider issues user accounts and access to applications and knowledge bases, supplies non-returnable equipment and user guides, and conducts onboarding sessions and ongoing consultations to help users work effectively with the service.

Which lifecycle management activity **BEST** describes the work being carried out in this scenario?

- A. Deliver
- B. Transition
- C. Operate
- D. Support

6. Users of an online booking system report intermittent access issues during peak hours. A support team responds to user queries, restores access where possible, and investigates alerts generated by system monitoring tools to identify and resolve the underlying cause of the issues.

Which lifecycle management activity **BEST** describes the work being carried out in this scenario?

- A. Deliver
- B. Transition
- C. Operate
- D. Support

7. An organization is exploring opportunities to expand its digital services. Before deciding what to develop next, a team works with internal and external stakeholders to understand their expectations, identify unmet needs, and document requirements that will guide future product and service decisions.

Which management practice **MOST** enables this activity in this scenario?

- A. Architecture management
- B. Business analysis
- C. Portfolio management
- D. Risk management

8. Please refer to the ITIL Car Rental scenario for additional context when answering this question.

ICR is considering enhancements to its customer-facing booking and rental platform following recurring friction points observed in several regions. Before committing to new features, Omar convenes a cross-functional working group to better understand the broader context. User personas are revisited to clarify who the primary users are in different markets and what problems ICR is trying to solve when booking or modifying rentals.

What should be the **NEXT** step?

- A. Engage with diverse stakeholders to strengthen the overall perspective
- B. Convert the insights into a clearly articulated product direction and intent
- C. Examine current services and components to identify interdependencies
- D. Share the rationale and expected benefits of the proposed

9. During a discovery exercise for a new digital product feature, decisions are made primarily based on senior stakeholders' opinions and past experience. After implementation, the feature shows limited adoption.

Which recommendation for success should the service provider focus on **MOST** to avoid similar outcomes in future?

- A. Enhancing early cooperation between business and technical teams during discover
- B. Promoting frequent, low-risk experimentation by reducing formal evaluation and controls
- C. Increasing senior leadership involvement to speed up approvals and secure resources
- D. Defining testable assumptions and tracking performance indicators during validation

10. Please refer to the ITIL Car Rental scenario for additional context when answering this question.

ICR is exploring a new mobile feature to allow customers to modify bookings in real time. A senior leader is convinced it will improve loyalty and pushes the team to move forward quickly. Without further analysis, the feature is introduced to users. Even with new features, adoption is low and customer satisfaction remains unchanged.

Which recommendation is **NOT** being followed by leadership?

- A. Strong leadership sponsorship
- B. Scalable infrastructure and practices
- C. Effective supplier relationship management
- D. Evidence-based decision-making

11. A digital product team redesigns a customer portal based largely on internal assumptions and feedback from a small group of internal stakeholders. After release, users report that key tasks are difficult to complete, and adoption remains low.

Which action would **BEST** address the issues described in this scenario?

- A. Selecting a single design framework to standardize future solution design
- B. Accelerating delivery cycles so improvements can be released more frequently
- C. Taking design decisions in validated research of real user behaviours and needs
- D. Increasing governance controls to ensure designs follow approved standards

12. A new digital service is being designed that will significantly change how staff interact with customers and perform daily work. Roles will shift, new skills will be required, and users will need to adapt to new ways of working for the service to be successfully adopted.

How can organizational change management effectively support the 'design' activity in this scenario?

- A. By defining user responsibilities and behaviours that reduce the risk of misuse and protect sensitive information
- B. By encouraging feedback from staff and using lessons learned to refine how future changes are designed
- C. By designing the role, process, and behavioural changes needed for effective service operation and adoption
- D. By eliciting and documenting user needs and expectations to shape how the service should be used

13. Please refer to the ITIL Car Rental scenario for additional context when answering this question.

After identifying problems in the booking journey, ICR considers adding subscription-style rentals and flexible insurance options. Omar wants to ensure that previous insights are still relevant. The team reviews the product roadmap and backlog, analyses booking trends and regional usage data, benchmarks competitors, and revisits recent customer interviews and survey findings.

Which step of the 'design' activity is being performed in the scenario?

- A. Conducting a market demand assessment to determine whether continued investment in new rental models is justified
- B. Preparing and organizing the methods, resources, and stakeholders required to initiate structured service design work
- C. Converting planned designs into tested, version-controlled artifacts through iterative sprints, continuous feedback
- D. Communicating agreed solution specifications and implementation plans to stakeholders for alignment

14. Please refer to the ITIL Car Rental scenario for additional context when answering this question.

ICR is preparing a new digital capability to support future mobility services across several regions. The solution was designed primarily by architects and developers, with a strong focus on technical feasibility and speed of delivery. While the proposed solution meets functional expectations, there is uncertainty about how it will perform once it is widely used and supported in live environments. The Chief Information Officer (CIO) wants to reduce the risk of rework, service disruption, and poor adoption once the capability is introduced.

Which action would **BEST** address this concern before the solution progresses further?

- A. Engage operation teams during design so operational needs are addressed early
- B. Increase the frequency of solution reviews to accelerate feedback from senior leadership
- C. Finalize the solution documentation so delivery teams can prepare for implementation
- D. Proceed with a limited rollout to identify operational gaps during early use

15. An organization plans to buy external software and cloud services to support a new digital product. Before procurement begins, the team evaluates potential service providers, selects a suitable external service provider, negotiates agreements, and ensures that contractual terms support ongoing collaboration and service expectations.

Which management practice **MOST** enables the activity being performed in this scenario?

- A. Architecture management
- B. Service financial management
- C. Supplier management
- D. IT asset management

16. Please refer to the ITIL Car Rental scenario for additional context when answering this question.

ICR has selected a sourcing approach for new digital capabilities after reviewing internal and external options. Suitability, risks, and alignment with operating principles have been agreed. Before any resources are made available to delivery teams, ICR wants to ensure expectations, responsibilities, and obligations are clear and enforceable.

What should ICR do **NEXT**?

- A. Formalize responsibilities, obligations, and conditions with the selected parties
- B. Reassess sourcing options and review supplier performance information
- C. Validate supplier capabilities against operational and regulatory requirements
- D. Update internal records to reflect sourcing decisions and approvals

17. An organization procures external technology services through multiple suppliers. Although contracts are in place, sourcing decisions are often driven by short-term cost pressures and individual departmental needs. Over time, the organization experiences duplicated purchases, limited visibility of supplier performance, and difficulty explaining how procurement decisions support broader business objectives.

Which action would **BEST** address the issues described in this scenario?

- A. Expanding risk assessments to cover regulatory and ethical compliance requirements
- B. Aligning sourcing decisions more closely with organizational strategy and objectives
- C. Strengthening staff skills through additional negotiation and supplier training
- D. Introducing automation tools to reduce manual procurement tasks and approval times

18. Please refer to the ITIL Car Rental scenario for additional context when answering this question.

ICR selected a cloud analytics provider under a multi-year agreement to support its digital booking platform. Over time, customer behaviour and data usage patterns evolved significantly. However, the organization discovered that modifying or exiting the contract would incur substantial penalties, making it difficult to adapt its sourcing strategy.

Looking back, which action during acquisition planning would **MOST** effectively have reduced this risk?

- A. Enforce traceability and accountability throughout the acquisition chain
- B. Design contracts and sourcing models with flexibility in mind
- C. Verify that acquisition outputs satisfy the needs of all downstream professionals
- D. Engage procurement and supplier experts early during planning and design stages

19. A digital product team is building a new online service that will process sensitive customer data. During development, the team needs to ensure that access controls, data protection mechanisms, and the secure handling of information are built into the product and verified through testing before release.

How would a management practice **MOST** effectively support the 'build' activity in this scenario?

- A. By embedding and validating security controls as part of the product build and testing activities
- B. By collecting feedback from incidents and applying lessons learned to future product enhancements
- C. By defining acceptable user behaviours to reduce the likelihood of security incidents during service use
- D. By documenting user needs to determine how securely information should be accessed

20. Please refer to the ITIL Car Rental scenario for additional context when answering this question.

ICR has finalized the design of a new AI-enabled feature in its unified mobile app. The required cloud capacity and specialist skills have been confirmed. Sam's team develops the feature within the shared app framework, integrates it with booking and payment modules, performs unit and integration testing, validates security controls, and prepares operational runbooks before pilot launch.

Which step of the 'build' activity is **PRIMARILY** being applied?

- A. Assess solution design to confirm alignment with architecture and resource feasibility
- B. Plan building and testing activities and confirm resource availability
- C. Execute building and testing plans
- D. Deliver solutions and supporting documentation for transition

21. A product team frequently releases updates to a digital service, but each release introduces unexpected defects. Fixes for one issue often cause new problems elsewhere, deployments require significant manual effort, and the team lacks the confidence to release changes quickly. As a result, delivery slows down and customer-impacting incidents increase.

Which recommendation would **BEST** address the issues described in this scenario?

- A. Selecting an architectural style that supports future scalability and extensibility
- B. Instrumenting the service with dashboards and alerts to improve operational visibility
- C. Expanding documentation to ensure all stakeholders understand the product design
- D. Automating build, test, and deployment steps to verify changes and reduce manual errors

22. A new version of a digital service is released into the live environment after development and deployment activities are completed. Shortly after launch, users report slow response times and security weaknesses that prevent normal use of the service. Investigation shows that these issues could have been identified before release if structured checks against agreed requirements had been carried out.
- How would service validation and testing practice have **MOST** effectively prevented the issues described in this scenario?
- A. Planning release timing and coordinating related stakeholder communications
 - B. Preparing technical infrastructure to support the transitioned service
 - C. Verifying the service meets agreed requirements before release
 - D. Reviewing transition outcomes to capture feedback for future improvements
23. Please refer to the ITIL Car Rental scenario for additional context when answering this question.
- ICR has completed building and testing a new autonomous ride booking capability within its unified mobile app. Before releasing it across all markets, Omar coordinates a controlled pilot in two countries. The team prepares user training materials, aligns incident response procedures, confirms monitoring dashboards are active, and schedules deployment windows. Resource availability for operational support is verified.
- Which step of the 'transition' activity is **PRIMARILY** being applied in this scenario?
- A. Assess solutions and transition requirements
 - B. Plan transition activities and confirm resource availability
 - C. Execute transition plans
 - D. Communicate transition results to stakeholders
24. Please refer to the ITIL Car Rental scenario for additional context when answering this question.
- Sam confirms that system diagrams, interface details, configuration settings, and deployment instructions exist. During review, Omar finds that configuration values differ between repositories, version references are inconsistent, and responsibility for certain components is unclear. The go-live window is approaching, and Max asks for assurance that operations will not struggle after release.
- What should Omar do before approving release?
- A. Align artifacts with defined ownership and consistent versions
 - B. Expand monitoring to detect configuration differences
 - C. Perform additional integration validation across regions
 - D. Confirm release timing and adjust documents later
25. A university is implementing a new cloud-based student learning portal. The team assigns a responsible owner for each task, estimates the effort required and documents dependencies between tasks to avoid bottlenecks.
- Which output is **MOST LIKELY** being created during this activity?
- A. Transition plans
 - B. Operational plans
 - C. Requirements assessment report
 - D. IT asset registers

26. A live digital service experiences repeated service disruptions that are restored quickly, but the same issues continue to occur. Over time, temporary fixes increase operational effort, and overall service reliability gradually declines.

How can the problem management practice **MOST** effectively help address the situation described?

- A. By adjusting monitoring thresholds and dashboards to detect and resolve service issues earlier
- B. By analysing recurring incidents and improving how known issues are controlled and prevented
- C. By coordinating operational changes that apply temporary workarounds consistently
- D. By reviewing service performance data to identify trends for future improvement planning

27. During the daily operation of a live digital service, the team closely observes system behaviour, tracks service performance against agreed thresholds, and records service disruptions as they occur. This information is reviewed to ensure the service continues to meet expected levels of reliability.

Which output of the 'operate' activity is **MOST** directly produced by the work described in this scenario?

- A. Updated operational procedures reflecting changes in how the service is supported
- B. Performance metrics, event records, and logs generated from live service monitoring
- C. Workarounds and known-issue records created to reduce the impact of recurring faults
- D. Improvement recommendations derived from analysing operational data over time

28. Please refer to the ITIL Car Rental scenario for additional context when answering this question.

ICR is stabilizing its global booking platform after a major expansion into new markets. Omar notices that although the system is currently stable, recurring activities such as performance reviews, security inspections, and cost evaluations are being handled inconsistently across regions. To address this, the team establishes a structured cadence of recurring platform activities throughout the year. For each activity, they identify the tools required, the specific expertise needed, and ensure individuals are formally accountable.

Which step of the 'operate' activity does this scenario describe?

- A. Communicate transition results to stakeholders
- B. Execute operational monitoring and remediation
- C. Plan operations activities and confirm resource availability
- D. Communicate operational results to stakeholders

29. A digital service is operating in a live environment, but operational teams rely on isolated tools and informal updates to understand service health. Performance issues are often discovered only after users are affected, and teams struggle to explain trends. As a result, decisions are reactive and service reliability varies.

Which critical success factor would **BEST** help address the situation described in this scenario?

- A. Using elastic infrastructure to maintain performance while controlling operational costs
- B. Feeding lessons learned back into runbooks, alerts, and safeguards to improve resilience
- C. Embedding security checks and compliance controls into everyday operational activities
- D. Establishing end-to-end visibility with shared operational metrics and performance indicators

30. Please refer to the ITIL Car Rental scenario for additional context when answering this question.

ICR has expanded its mobile platform rapidly to support new mobility services. To meet tight release timelines, teams introduced temporary architectural compromises, incomplete documentation, and short-term fixes that were never revisited. Over time, service instability increases. Incident resolution takes longer because underlying dependencies are poorly understood.

Which recommendation should be applied to address this situation?

- A. Structure data before implementing AI
- B. Treat technical debt as a serious risk
- C. Focus on quality and speed
- D. Design teams based on the organization's context

31. During day-to-day service delivery, users contact the organization to ask questions about how to use the service, report issues with access, and request guidance on available options. A centralized team records these interactions, provides initial assistance where possible, and ensures that requests and issues are routed appropriately for further handling.

Which management practice is **MOST** directly responsible for the activities described in this scenario?

- A. Incident management
- B. Service request management
- C. Service desk
- D. Relationship management

32. A service provider has reviewed agreed service commitments, including service levels, outstanding service requests, and recent events that could affect delivery. Now, based on this review, the provider decides how services will be delivered and what resources and tools are required.

Which output is **MOST** directly produced by this activity?

- A. Delivery readiness assessment report
- B. User feedback records
- C. Delivery plans and procedures
- D. Delivery records and performance reports

33. Please refer to the ITIL Car Rental scenario for additional context when answering this question.

ICR has successfully transitioned a new subscription-based rental model into live environments. Before activating it for customers in three regions, Anna reviews existing service level agreements, verifies that the subscription module supports agreed booking commitments, confirms multilingual support coverage, and checks that sufficient customer support agents are scheduled for launch week.

Which step of the 'deliver' activity is **PRIMARILY** being applied?

- A. Assess service delivery commitments and available solutions
- B. Identify and confirm delivery plan and resource availability
- C. Execute delivery plans and report delivery status to stakeholders
- D. Define vendor-partner responsibilities for app-centric delivery

34. A service provider regularly introduces improvements to how services are delivered, such as new request workflows, updated communication templates, and revised fulfilment steps. Although each change is intended to improve efficiency, users and delivery staff report growing frustration. Feedback indicates confusion about what has changed, reduced confidence in the service, and declining satisfaction during periods of frequent updates.

Which action would **BEST** help address the situation described in this scenario?

- A. Increasing the level of automation used to fulfil service requests
- B. Applying delivery improvements to a limited group first and adjusting the approach based on early feedback
- C. Updating service agreements to clearly document the latest delivery processes
- D. Expanding feedback surveys to collect more detailed user opinions

35. Please refer to the ITIL Car Rental scenario for additional context when answering this question.

ICR has introduced AI-enabled self-service features in its unified mobile app to speed up booking changes and subscription upgrades. Although automation rates are high, customer satisfaction has declined. Users report frustration when complex cases cannot be escalated quickly to human agents.

Which action would **BEST** align with the practical recommendations for effective delivery?

- A. Increase automation coverage further to reduce operational costs
- B. Deploy AI self-service while defining clear escalation thresholds to human support
- C. Reduce monitoring of delivery metrics to focus on feature innovation
- D. Delay customer access to new features until automation reaches 95% resolution

36. A live software application occasionally requires configuration changes or emergency fixes to restore normal service or support recovery after major incidents. Applying such changes without analysing risks associated with such changes may cause instability in the live environment.

How does the change enablement practice **MOST** effectively support this situation?

- A. By deploying fixes into the live environment quickly to reduce disruption
- B. By monitoring the impact of fixes after they are applied to confirm stability
- C. By assessing, authorizing, and coordinating changes before fixes are applied
- D. By analysing the underlying causes of issues to prevent recurrence

37. A software product offers user support through email, chat, phone, and social media, but each channel is handled using separate tools and workflows. Requests are sometimes duplicated, conversation history is fragmented, and response times vary widely when demand increases in one channel but available staff are assigned elsewhere. Team leaders lack a clear, real-time view of overall workload and struggle to rebalance resources during peak periods.

Which action would **BEST** address the issues described in this scenario?

- A. Increasing the number of support agents available during peak demand periods
- B. Consolidating all support channels into a single platform with unified routing and visibility
- C. Expanding self-service options to reduce the volume of user contacts
- D. Introducing stricter escalation rules for high-priority support requests

38. Please refer to the ITIL Car Rental scenario for additional context when answering this question.

After launching a new subscription feature in its unified mobile app, ICR detects an unexpected spike in failed payment transactions in one region. The monitoring system flags the issue, and the support team evaluates its impact on customers and revenue. They classify the issue as high priority and determine that it is affecting a significant number of active users.

Which step of the 'support' activity is **PRIMARILY** being applied?

- A. Identify and assess incidents and disasters
- B. Respond to incidents/disasters and restore normal operations and delivery
- C. Review and report support actions
- D. Execute operational plans and report operational status to stakeholders

39. A software company specializes in developing custom applications for individual enterprise customers. Each solution is tailored to the customer's requirements. Customers are actively involved in shaping the solution and validating outcomes, while the software company designs and builds the product.

In this operating model, who is typically responsible for the 'transition' activity?

- A. The customer and the software provider jointly
- B. The customer's business users only
- C. The software development team alone
- D. An external managed service provider after handover

Thank you for completing this course!

Please take a few minutes to give us your feedback on your experiences and learning from the course by completing the online course evaluation survey [here](#).
